

PRODUCT REQUIREMENTS DOCUMENT

PROJECT: TACTICAL PITCH SIMULATOR | ID: WD-FENRIR-001

1. Executive Summary

This project outlines the development of an MVP frontend validation prototype for a browser-based football management simulator. The objective is to build a fluid, interactive Single Page Application (SPA) that demonstrates complex state management and dynamic UI theming driven by a static dataset. The application must feel premium, utilizing fluid animations without relying on backend architecture.

2. The Asset Package (Data & Layout)

The developer is provided with two foundational assets. These dictate the absolute boundaries of the layout and the sole source of truth for the application data.

- **UI Wireframe (`reference_image.png`)**: Mandates the spatial layout. A persistent sidebar must occupy exactly 250px on the left, with the main dynamic canvas set to a `#121212` dark theme background.
- **Dataset (`teams.jsx`)**: A static JSON array containing 20 football clubs. Each object includes keys for the club's name, `primary_hex`, and `logo_path`. *No data structure alterations are permitted.*

3. Core Architectural Requirements

Framework / Library	Purpose & Constraint
React 18+ & Vite	Strictly vanilla JS (No TypeScript). No Server-Side Rendering (Next.js is forbidden).
React Router DOM	Must handle seamless client-side routing without browser reloads.
Framer Motion	Mandatory for all page transitions (<code><AnimatePresence></code>) and interaction hover states.

4. Functional Scope & Routing

Route 1: Dashboard (/)

A landing view rendering a grid of all 20 clubs mapped from `teams.jsx`. Each club card must feature a Framer Motion `whileHover={{ scale: 1.05 }}` interaction.

Route 2: Locker Room (/squad)

An interactive squad builder rendering exactly 11 empty slots mapped into a 4-3-3 visual formation.

- **Constraint:** The global state must strictly cap the active squad array at a maximum of 11 players.
- **Validation:** The UI must disable the navigation/action to simulate a match until exactly 11 players are slotted.

Route 3: Match Day (/simulation)

A static output screen that calculates and displays a win probability percentage based on the selected squad.

5. Dynamic Theming Engine

CRITICAL REQUIREMENT: No brand colors or logos may be hardcoded into the CSS files.

The global state must track the user's `activeClub`. Upon selection, the application must immediately:

1. Extract the `primary_hex` string from the selected club's object and apply it as the background color of the persistent 250px left Sidebar.
2. Extract the `logo_path` string and render the image at exactly 64x64px in the top-left header component.

6. Out of Scope (Forbidden Elements)

- No backend server logic (Node/Express, Python).
- No database integrations (Firebase, Supabase, MongoDB) or authentication layers.
- No complex multiplayer networking or WebSockets.
- No heavy CSS gradients, drop shadows, or generic Bootstrap components.

7. Deliverable Specifications

The final handoff must be a Zipped Source Code archive. The `node_modules` folder must be explicitly excluded from the zip. The file must adhere strictly to the following naming convention:

FENRIR_pitch-simulator-src_v1.0_YYYY-MM-DD.zip
